These topics are interconnected and form the basis for understanding how elements interact and form compounds.

Atomic Structure and the Periodic Table

Understanding the structure of atoms and the organization of elements is vital in chemistry. This section covers atomic models, atomic number, mass number, isotopes, and the arrangement of elements in the periodic table.

Atomic Structure

- Atoms are the basic units of matter, composed of three subatomic particles:
- Protons: positively charged particles found in the nucleus.
- Neutrons: neutral particles also in the nucleus.
- Electrons: negatively charged particles orbiting the nucleus in energy levels or shells.
- Atomic Number (Z): the number of protons in an atom; unique to each element.
- Mass Number (A): the total number of protons and neutrons in an atom.
- Isotopes: atoms of the same element with different numbers of neutrons but the same atomic number.

The Periodic Table

- Elements are arranged based on increasing atomic number.
- The periodic table is divided into groups (vertical columns) and periods (horizontal rows).
- Groups have similar chemical properties; for example:
