Operational Cycle of the SP715A

Ignition Sequence

When the thermostat calls for heat, the SP715A initiates the ignition process by activating the ignitor (hot surface or spark). It then monitors for the presence of a flame via the flame sensor. If a flame is detected within the specified timeout, the control allows the burner to operate normally. If no flame is detected, it will shut off the gas supply to prevent dangerous conditions and attempt re-ignition after a delay.

Flame Monitoring and Safety Shut-off

- The flame sensor uses flame rectification to confirm flame presence.
- If the flame is lost during operation, the SP715A immediately halts gas flow to prevent unburned gas accumulation.
- After a predefined number of failed ignition attempts, the control may lock out further ignition cycles to ensure safety.

Common Troubleshooting Tips

Identifying Typical Problems

- **Failure to Ignite:** Check the ignitor for damage or disconnection. Ensure the gas supply is operational.
- **No Flame Detection:** Inspect the flame sensor for dirt or damage. Verify wiring connections.
- **Erratic Operation:** Examine wiring for shorts or loose connections. Confirm that the control module is securely mounted.
- **Control Lockout:** Reset the system following manufacturer instructions. Check for repeated failures that could indicate underlying issues.

Step-by-Step Troubleshooting

- Verify power supply voltage with a multimeter.
- Inspect and clean the flame sensor if dirty or corroded.
- Test ignitor resistance to ensure proper operation.
- Check wiring continuity and connections between the control and components.
- Replace the SP715A if it shows signs of damage or persistent faults.
