Puzzle 1: Find the Unknown Angle in a Triangle

Problem: In triangle ABC, angle A measures 35° , and angle B measures 65° . What is the measure of angle C?

Solution:

- Recall the triangle angle sum property: angles in a triangle sum to 180° .
- Sum of known angles: $35^\circ + 65^\circ = 100^\circ$.
- Therefore, angle C = $180^\circ - 100^\circ = 80^\circ$.

Puzzle 2: Opposite Angles in Intersecting Lines

Problem: Two straight lines intersect, forming four angles. One of the angles is 120° . What are the measures of the vertically opposite angles?

Solution:

- Vertical angles are equal.
- The angles adjacent to the 120° angle are supplementary: they sum to 180° .
- So, the adjacent angles are $180^\circ - 120^\circ = 60^\circ$.
- The vertically opposite angles to 120° are also 120° , and the other pair is 60° .

Answer: The opposite angles are 120° and 60° .

Solution:

- In a circle, the measure of an inscribed angle is half the measure of its intercepted arc.
- The sum of the inscribed angles in a triangle is 180° , so:
- Third angle = $180^\circ - (40^\circ + 60^\circ) = 80^\circ$.
- Since all angles are inscribed angles, their intercepted arcs are twice their measures:
- The arc opposite the 80° angle measures 160° .
- The other arcs are 80° and 120° , respectively.
- The third inscribed angle intercepts the remaining arc, which measures 120° .

Answer: The third inscribed angle measures 60° .

Example Angles Puzzles with Detailed Solutions

Let's explore some classic and challenging angles puzzles, complete with step-by-step solutions.

Puzzle 1: Finding an Unknown Angle in a Triangle

Problem: In triangle ABC, angle A is 40° , and angle B is twice angle C. Find the measure of angles B and C.

Solution:

- Define Unknowns:

Let angle C = x° .

- Express Known Angles:

- Angle B = $2x^\circ$

- Angle A = 40°

- Use Triangle Angle Sum Property:

Sum of angles in triangle ABC:

$$40^\circ + 2x^\circ + x^\circ = 180^\circ$$

- Solve for x:

$$40^\circ + 3x^\circ = 180^\circ$$

$$3x^\circ = 180^\circ - 40^\circ = 140^\circ$$

$$x^\circ = 140^\circ / 3 \approx 46.67^\circ$$

- Find angles B and C:

- Angle C = $x \approx 46.67^\circ$
- Angle B = $2x \approx 93.33^\circ$

Answer:

- Angle B $\approx 93.33^\circ$
- Angle C $\approx 46.67^\circ$

Puzzle 2: Parallel Lines and Transversals

Problem: Two parallel lines are cut by a transversal. If one of the alternate interior angles measures 65° , what is the measure of the corresponding angle on the same side of the transversal?

Solution:

- Identify Given:

- Parallel lines cut by a transversal
- Alternate interior angle = 65°

- Recall Properties:

- Alternate interior angles are equal.
- Corresponding angles are equal.

- Determine the corresponding angle:

Since the corresponding angle on the same side of the transversal is equal to the alternate interior angle:

Answer: 65°

Puzzle 3: Supplementary Angles in a Quadrilateral

Problem: Quadrilateral PQRS has angles P and R as supplementary. If angle P measures 110° , find the measure of angle R.

Solution:

- Given:

- $\angle P = 110^\circ$
- $\angle P$ and $\angle R$ are supplementary

- Use Supplementary Angles Property:

$$\angle P + \angle R = 180^\circ$$

- Calculate $\angle R$:

$$110^\circ + \angle R = 180^\circ$$

$$\angle R = 180^\circ - 110^\circ = 70^\circ$$

Answer: 70°

Puzzle 4: An Isosceles Triangle Problem

Problem: In triangle XYZ, sides XY and XZ are equal. The base angles at Y and Z are in the ratio 2:3. Find the measures of angles Y and Z.

Solution:

- Define Variables:

Let:

- $\angle Y = 2k^\circ$
- $\angle Z = 3k^\circ$

- Use Triangle Angle Sum:

$$\angle X + \angle Y + \angle Z = 180^\circ$$

- Express $\angle X$:

Because $XY = XZ$, angles Y and Z are base angles and are equal in measure if the triangle is isosceles. However, the problem states their ratio, not equality, so the triangle is isosceles with sides $XY = XZ$, and angles at Y and Z are the base angles.

Since sides $XY = XZ$, then angles at Y and Z are equal:

But the problem states the angles are in ratio 2:3, which suggests a contradiction unless the ratio is applied to the angles at Y and Z.

Let's clarify:

- In an isosceles triangle with $XY=XZ$, angles at Y and Z are base angles, and they are equal.

- But the problem states their ratio is 2:3, so perhaps the triangle is not isosceles after all, or the wording is ambiguous.

Assuming the triangle's base angles at Y and Z are in ratio 2:3, but sides XY and XZ are equal, implying that angles at Y and Z are equal, contradicting the ratio unless the ratio is between other angles.

Alternative interpretation: The problem possibly intends for the base angles at Y and Z to be in ratio 2:3, with sides XY and XZ being equal, making it an isosceles triangle with base at YZ.

In an isosceles triangle with sides $XY = XZ$, angles at Y and Z are equal, so their ratio is 1:1, which conflicts with 2:3 unless the problem is different.

Final assumption:

- The angles at Y and Z are in ratio 2:3.
- Sum of angles in triangle XYZ:

$$\angle Y + \angle Z + \angle X = 180^\circ$$

- Since $XY = XZ$, angles at Y and Z are equal, so:

$$\angle Y = \angle Z$$

But that conflicts with the ratio unless the ratio applies to angles at other points.

Corrected Approach:

Let's suppose the problem is:

In an isosceles triangle XYZ with sides $XY = XZ$, the base angles at Y and Z are in ratio 2:3. Find the measures of these angles.

Solution:

- Define angles:

- $\angle Y = 2k^\circ$
- $\angle Z = 3k^\circ$

- Since the triangle is isosceles with $XY = XZ$, the base angles are at Y and Z, which are equal if sides are $XY = XZ$.

Therefore, the angles at Y and Z are equal, which contradicts the ratio unless the problem involves different sides.

Alternatively, the problem might be:

In triangle XYZ, sides XY and XZ are equal, and angles at Y and Z are in ratio 2:3. Find their measures.

Solution:

- Sum of angles:

$$\angle Y + \angle Z + \angle X = 180^\circ$$

$$\angle Y = 2k^\circ, \angle Z = 3k^\circ$$

$$\angle X = 180^\circ - (2k + 3k) = 180^\circ - 5k$$

- Since sides XY and XZ are equal, angles at Y and Z are equal, which
