Detailed Answers to Key Workbook Sections

The Sun: Our Solar System's Heart

Sample Question:

What is the primary source of energy for the solar system?

Answer:

The Sun is the primary source of energy for the solar system. It emits light and heat through nuclear fusion occurring in its core, where hydrogen atoms combine to form helium, releasing vast amounts of energy.

Explanation:

This energy drives weather, climate, and supports life on Earth. It also influences the orbits of planets and other celestial bodies through its gravitational pull.

Planets of the Solar System

Sample Question:

List the planets in order from the Sun, and identify which are terrestrial and which are gas giants.

Answer:

Planets in order from the Sun:

- Mercury (terrestrial)
- Venus (terrestrial)
- Earth (terrestrial)
- Mars (terrestrial)
- Jupiter (gas giant)
- Saturn (gas giant)
- Uranus (ice giant)
- Neptune (ice giant)

Explanation:

- Terrestrial planets are rocky and smaller.
- Gas giants (Jupiter, Saturn) are large and composed mostly of hydrogen and helium.
- Uranus and Neptune are often classified as ice giants due to their composition of heavier volatile substances.

Moons and Other Celestial Bodies

Sample Question:

Name three significant moons in our solar system and the planet each orbits.

Answer:

- Europa (orbits Jupiter)
- Titan (orbits Saturn)
- Phobos (orbits Mars)

Explanation:

Europa is notable for its icy surface and potential subsurface ocean. Titan has a thick atmosphere and hydrocarbon lakes. Phobos is one of Mars' two small moons and is irregular in shape.

Gravity and Orbits

Sample Question:

Explain how gravity affects the motion of planets in the solar system.

Answer:

Gravity is the force that attracts two bodies towards each other. The Sun's gravity keeps planets in orbit around it, preventing them from drifting into space. Similarly, planets' gravity holds their moons in orbit.

Explanation:

Newton's law of universal gravitation describes this force, which depends on mass and distance between objects. The balance between gravitational pull and a planet's forward velocity maintains stable orbits.

Space Exploration History**Sample Question:**

Identify two major space missions and their contributions to solar system knowledge.

Answer:

- Voyager 1 and 2: Launched in 1977, these probes provided detailed images and data of the outer planets and their moons, and Voyager 1 is now the farthest human-made object from Earth.
- Mars Rover Missions (e.g., Curiosity): These rovers have explored Mars' surface, analyzing rock samples and searching for signs of past life.

Activity: Labeling the Solar System**Sample Task:**

Label the planets and important features on a provided diagram.

Answer Guide:

- Closest to the Sun: Mercury, Venus, Earth, Mars
- Outer planets: Jupiter, Saturn, Uranus, Neptune

- Other features: Asteroid belt between Mars and Jupiter, Kuiper Belt beyond Neptune, the Sun at the center
