Understanding Linear Functions

What Is a Linear Function?

A linear function is a mathematical function that creates a straight line when graphed on a coordinate plane. It is characterized by a constant rate of change, meaning the difference between y-values for equally spaced x-values remains the same throughout the function.

The general form of a linear function is:

$$- y = mx + c$$

Where:

- m is the slope of the line (rate of change)
- c is the y-intercept (the point where the line crosses the y-axis)

Key Features of Linear Functions

Understanding the features of linear functions helps in graphing, analyzing, and applying these functions effectively:

- Slope (m): Indicates the steepness of the line and the direction (positive slope rises, negative slope falls).
- Y-intercept (c): The value of y when x = 0.

- Graph: A straight line with a constant slope.
- Rate of change: The same between any two points on the line.

Graphing Linear Functions

To graph a linear function:

- Identify the y-intercept (c).
- Use the slope (m) to determine the rise over run.
- Plot the intercept and use the slope to find additional points.
- Draw a straight line through these points.

Applications of Linear Functions

Linear functions are used in numerous real-world situations:

- Calculating cost based on a fixed rate (e.g., taxi fare)
- Predicting population growth with a constant rate
- Analyzing speed and distance in physics
- Financial calculations like simple interest

Understanding Exponential Functions

What Is an Exponential Function?

An exponential function involves a variable in the exponent and exhibits rapid growth or decay. The general form is:

$$y = a b^x$$

Where:

- a is the initial value (when $x=0$)
- b is the base, which determines the rate of growth or decay
- x is the independent variable

If $b > 1$, the function models exponential growth; if $0 < b < 1$, the function models exponential decay.

Key Features of Exponential Functions

Understanding these features helps in analyzing their behavior:

- Initial value (a): The starting point when $x=0$.
- Growth or decay rate: Determined by the base b .
- Graph shape: Curves upward for growth or downward for decay.
- Asymptote: The horizontal line that the graph approaches but never touches (usually $y=0$).

Graphing Exponential Functions

To graph an exponential function:

- Plot the initial point (when $x=0$, $y=a$).
- Choose several x -values and compute corresponding y -values.
- Plot these points and draw a smooth curve.
- Note the asymptote, which guides the shape of the graph.

Applications of Exponential Functions

Exponential functions are vital in modeling:

- Population growth or decay
- Radioactive decay
- Compound interest in finance
- Spread of diseases
- Bacterial growth

Question What are the key differences between linear and exponential functions? Linear functions have a constant rate of change and are represented by a straight line, with the form $y = mx$

+ b. Exponential functions have a constant percentage rate of change, represented by $y = a b^x$, resulting in a curve that either grows or decays rapidly. How do you identify an exponential function from its graph? An exponential function's graph is a curve that either increases or decreases rapidly, never forming a straight line. It has a vertical asymptote and exhibits exponential growth or decay, unlike linear functions which are straight lines. What is the significance of the base in an exponential function $y = a b^x$? The base b determines the rate of exponential growth (if $b > 1$) or decay (if $0 < b < 1$).

- y is the response variable.
- $x_1, x_2, \dots, x_p$ are predictor variables.
